

Virtual Spout

The **High-Flow Virtual Spout**¹ offers a very discreet alternative to the traditional filler spout. This filling port is factory-installed on an inside wall of the tub and “stubbed-out” under the tub for onsite connection to the incoming water supply. Fill rate is 20 GPM at 45 PSI with Wilkins Dual Check Valve² installed. MTI does not provide mixing valves with the Virtual Spout.

Because the Virtual Spout is installed below the water level of the tub, special consideration is needed to prevent backflow into the fresh water supply. The Virtual Spout will always come with a Wilkins Dual Check Valve installed on the system (**Figure 1**) and a Cash Acme® in-wall vacuum breaker.³

Some areas of the country require additional backflow prevention above the water line of the tub. The provided vacuum breaker requires access through the wall and a spill tray (**Figure 2**). **Please check local codes, as some areas of the country require a deck-mounted backflow prevention device.**

Please indicate desired location of the fill port on spec sheet when ordering. The Virtual Spout cannot be combined with MTI's Fill-Flush cleaning system.

Please review the Owner's Manual / Installation Guide provided with tub for complete installation instructions.

The manual is also available at mtibaths.com.

Virtual Spout (FPMJ) \$475

Offered on most Designer Collection tub models.

See Options section on product specification sheet for availability.

Virtual Spout

Figure 2

¹This fixture is protected against backflow by the Zurn® Wilkins Dual Check Valve with additional backflow prevention provided via a Cash Acme® In-wall anti-siphon vacuum breaker.

Both are designed for installation on water lines to protect against both backsiphonage and backpressure of polluted water into the potable water supply.
